

TEXAS A&M UNIVERSITY

Computing and Information Services

October 12, 2004

MEMORANDUM

TO: Dr. Richard L. Floyd
Associate Vice President for Finance

FROM: Tom Putnam, Director

SUBJECT: Public Information Request 04-217 William Reading

Public information request 04-217 consists of two parts shown below in italics with our response interspersed.

- 1) *The specifications of the hardware and the extent of which Texas A&M University uses packet shaping technology to regulate the flow TCP/IP traffic including, but not limited to the name and model of the hardware, i.e. "Packeteer PacketShaper Model X" is deployed at location on campus and is used to regulate X type of traffic".*

There are three PacketShaper 6500s, software version 6.2.1, used on campus. All three are located in the machine room in Teague. Two are used in a redundant capacity installed between main campus and the residence hall network. The third is installed between main campus and the VPN concentrators. There is no responsive University document on hardware specifications beyond copyrighted vendor manuals. See attachment 1 regarding the "the extent of which Texas A&M University uses packet shaping technology to regulate the flow TCP/IP traffic".

- 2) *If Packeteer's PacketShaper or similar hardware is currently deployed at Texas A&M, the configuration used by the packet shaping hardware, including but not limited to all of the traffic policies configured in the devices currently and in years past relating to the following:*
- a) *General traffic policy rules*
 - b) *Traffic partition rules*
 - c) *Definitions of traffic classes*
 - d) *QoS classes / rules*
 - e) *Statistics of current bandwidth utilization and bandwidth utilization when the device was originally deployed*

For 2a, see Attachment 1: <http://net.tamu.edu/network/policy/trafficeng.html>.

All other requested information exists only as current data on the PacketShaper. For 2b-c-d, attachment 2 is a printout of the current configuration (CONFIG.LDI) with passwords removed (all three are identically configured). Attachment 3 is the stored, previous configuration. For 2e, attachment 4 is a snapshot of utilization. Peak rates are since last reset (less than one week ago) while other rates are just what was reported at the time of output on October 4, 2004. No other PacketShaper utilization data exist.

Please feel free to contact me if there are questions that are not be covered by the records.

Attachment 1 - Traffic Engineering Guidelines and Procedures
Attachment 2 - Current Packeteer Configuration
Attachment 3 - Previous Packeteer Configuration
Attachment 4 - Performance Statistics Snapshot (Oct. 4, 2004)

Attachment 1 - Traffic Engineering Guidelines and Procedures

Traffic Engineering (TE) consists of measuring network performance and modifying the network configuration to meet performance goals. Some traffic engineering takes place over long periods as connection data rates are upgraded or equipment is added or re-arranged. Other TE actions consist of automated prioritization and traffic shaping and policing for data flows as they are happening.

CIS TE goals are to optimize network performance for the following usages (in priority order):

- Research, teaching and administrative missions of the University and associated agencies;
- Other University and System sponsored activities;
- Incidental use by members of the University community; and
- Other activities not restricted by regulation or law.

Specific TE Areas

IPX

IPX can be (mis-)configured to make extensive use of IP Multicast packets as if it were link-layer broadcasts. IP multicast is disabled to any area where IPX IP multicast is configured. Assistance is available to system administrators wanting to better configure their systems.

Firewall

CIS maintains a [firewall](#) that restricts certain types of traffic for security and performance.

ResNet

Network usage within the Residence Halls (RESNET) has engendered several different kinds of performance problems, caused primarily by demand exceeding available network capacity. The initial scheme with published standards and manual monitoring did not control disproportionate usage. In Summer, 2001, RESNET building connections were upgraded and traffic between Residence Halls segregated from other campus traffic. RESNET traffic to/from the Internet and campus was set up on a separate link. RESNET/Internet traffic rose until congestion impacted priority usage. An automated traffic shaping system was installed in Fall, 2001, on the RESNET/Internet link. This device limits bandwidth taken up by most peer-to-peer protocols so that other services can be useful.

H.323

To Be Announced
